

Municipal Vulnerability Index: Your Town's Vulnerabilities and Climate Change

ANR Municipal Day

October 20, 2023

Goals

- Share progress to-date to develop a **Municipal Vulnerability Index (MVI)**.
 - **Gather input** on key MVI challenges and questions.
 - Share **other tools and resources** that indicate climate change vulnerabilities and opportunities.
- 
- A large orange triangle is positioned in the bottom right corner of the slide, pointing towards the top right.

Vermont Crop Damage Could Be Far Reaching after Mid-May Frost

Vermont grapples with historic flooding as more rainstorms head for Northeast

It's the worst flooding to hit Vermont since Tropical Storm Irene in 2011.

MVI Project Background

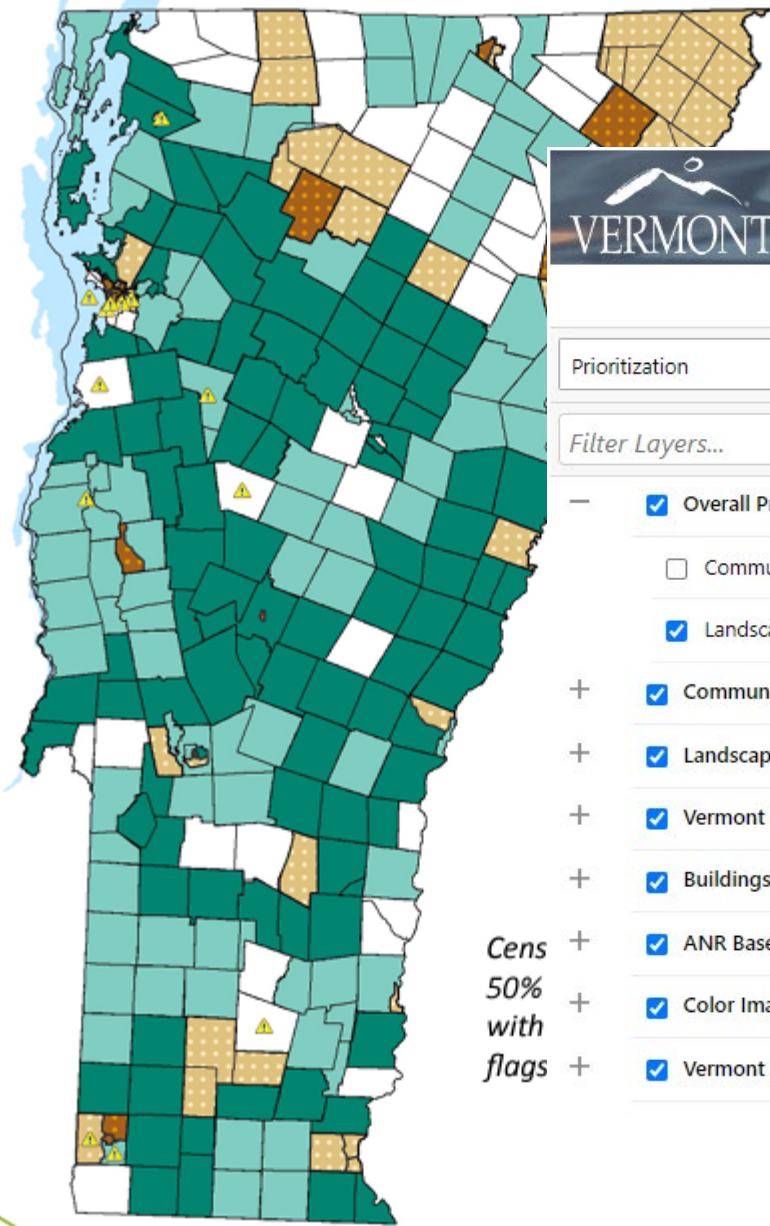

- Aim: Indicate municipalities' vulnerability to climate change based on a range of social, economic, and biophysical factors
- Information generated by the tool may be used to:
 - Develop local hazard mitigation, local and regional energy plans, or other climate-related plans and inform action.
 - Inform decisions about how to prioritize climate-related projects and funding within the state.

Stakeholder Engagement

- **MVI tool users:** Primary end users of the MVI tool (e.g., municipalities, regional planning commissions (RPCs), utilities).
- **Affected Populations:** Populations that may experience disproportionate impacts from climate change based on characteristics such as race, ethnicity, age, income, education, and geographic location. Engagement included representatives of organizations serving or working with these populations.
- **MVI Tool partners:** Entities whose work is parallel to, or overlaps with, the MVI tool where there is a need to align efforts.

MVI Domains

- **Social/Community** (e.g., demographic factors, municipal staff capacity, distance from emergency services and shelters)
- **Economic/Jobs** (e.g., unemployment rate, income, key economic sectors)
- **Built/Physical Environment** (e.g., transportation, utilities, mobile homes, impervious surfaces)
- **Natural Environment** (e.g., stream protection, critical habitat, air quality)
- **Natural Hazards** (e.g., flooding, extreme temperatures, drought)

Tool Factors: Selection Process

MVI Example Factors

Social/Community

- Single parent household
- Linguistic Isolation
- No internet
- Energy & transportation burden
- Housing cost burden
- Access to healthy foods
- ERAF Rate
- Public and civic organizations
- ACCD Designated Areas

Economic/Jobs

- Vulnerable employment
- Agriculture
- Tourism

Built/Physical

- Location of manufactured home communities in flood hazard area
- Critical assets (libraries, schools, hospitals)

Natural Environment

- Tree Canopy
- Conserved and protected lands
- River and stream protection
- Impervious surfaces

Infrastructure

- Roads, bridges, and culverts
- Power lines & utility poles
- Water and wastewater infrastructure

Selected Factors: Hazards

Factor	Data Source
Flood	<ol style="list-style-type: none">1. FEMA National Flood Hazard Layer2. VT Center for Geographic Information (Lake Champlain Basin)3. VT ANR River Corridors
Wildfire	U.S. Forest Service
Drought	U.S. Drought Monitor
High heat	LOCA Statistical Downscaling^[a]
Extreme precipitation	LOCA Statistical Downscaling^[a]
Wind	First Street Foundation^[b]
Cold	LOCA Statistical Downscaling^[a]
Hail	NOAA NCEI Storm Events Database^[c]
Blizzard	NOAA NCEI Storm Events Database^[c]

[a] LOCA data includes projections through 2100.

[b] First Street Foundation's data includes climate projections.

[c] The NOAA Storm Events Database provides the number of events, or the number of days with event, in a county.

Climate Projections – LOCA Data

- LOCA (*Localized Constructed Analogs*) is a technique for downscaling climate model projections of the future climate. Instead of getting very rough global climate model outputs, we can have data for the entire U.S. at a 6 km resolution.
- Used in the Fourth National Climate Assessment
- We are using this data to create metrics for projected high heat, cold, and extreme precipitation in VT for 2050.
- We plan to do this for SSP5-8.5 (very high emissions) and SSP2-4.5 (intermediate emissions)

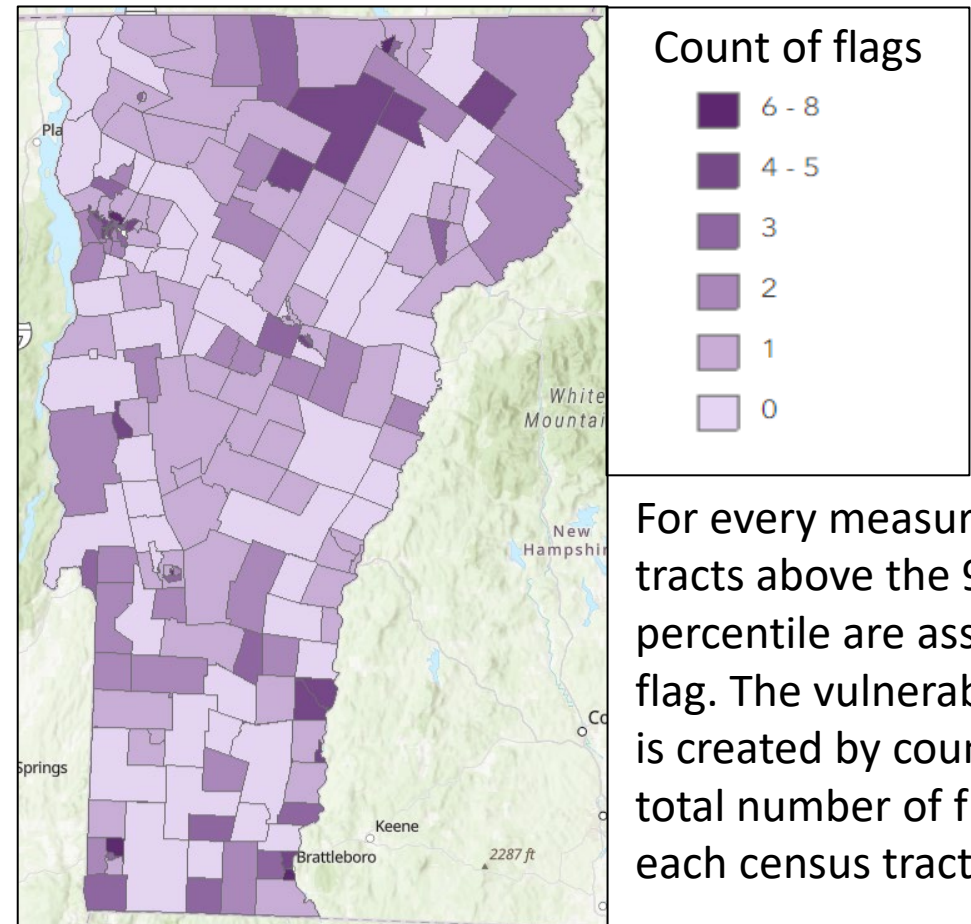

Factor	Metric
High heat	Number of days with maximum temperature > 90 °F
Cold	Number of days with minimum temperature < 32 °F
Extreme precipitation	Number of days with > 1 inch of precipitation

Conceptual framework

- Flexible, user-guided approach to understanding and exploring vulnerability.
- No single vulnerability score, but a range of flags to help identify the presence and scale of vulnerability

- Example of tool that “flags” vulnerability measures: VT Social Vulnerability Index

Questions

- What tool outputs would be helpful for your municipality to have to be better prepared for the next flood or heatwave?
- How would a tool like this be used in your climate-related planning processes?
- As your community reflects on the July flooding, what questions do you have about climate vulnerability and resilience?

Challenges and Opportunities

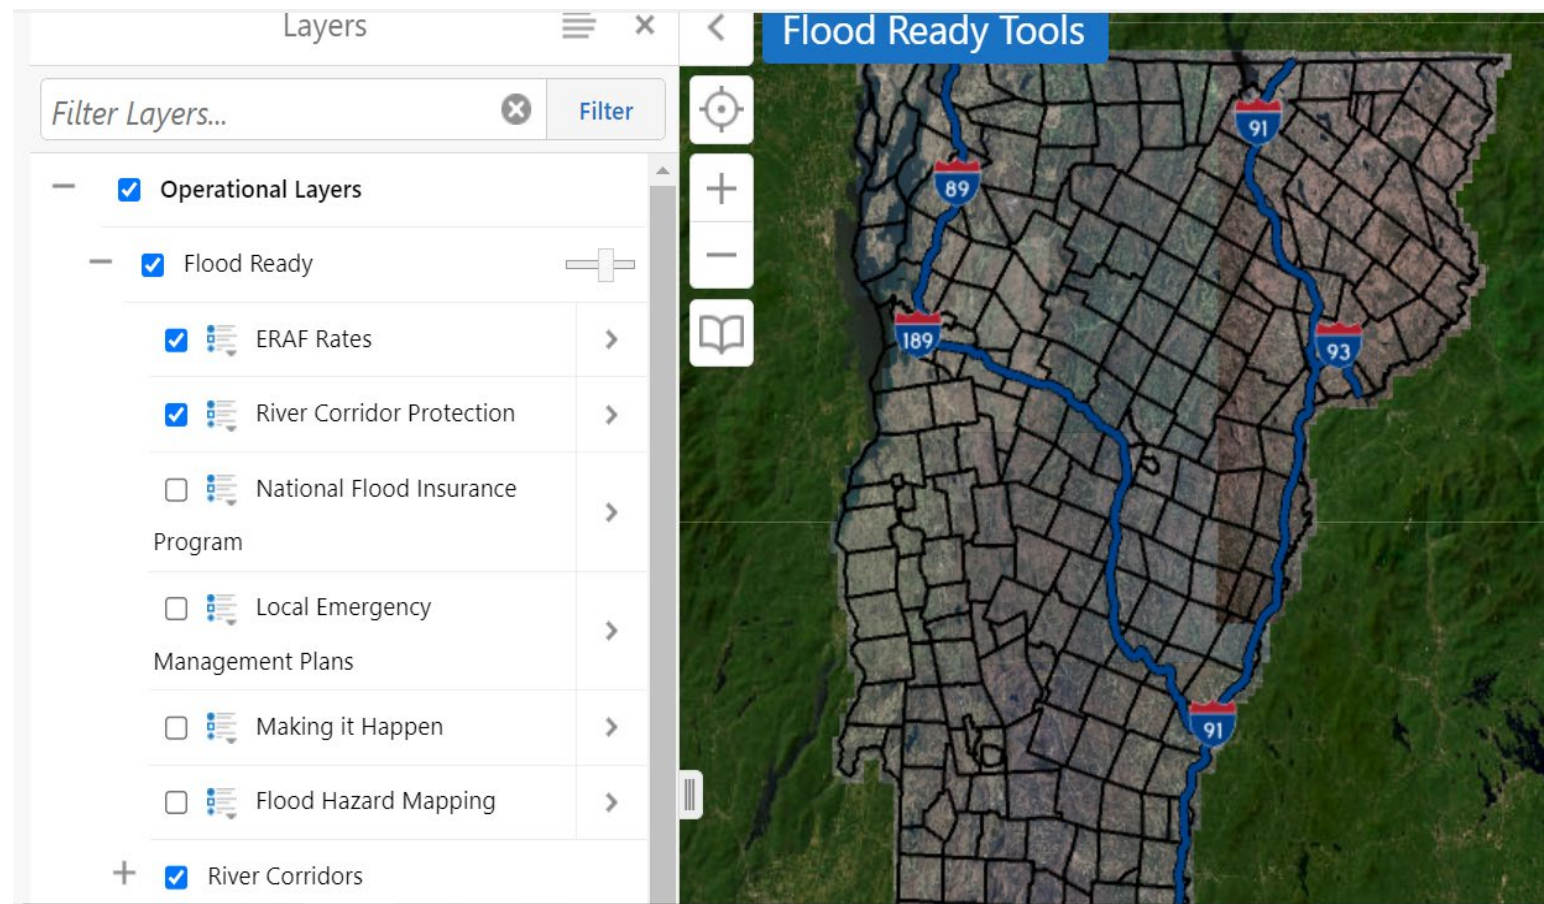

- Capacity and training
 - Scale of data
 - Vulnerability vs. opportunity
 - Shifting awareness to action
 - Metrics for community resilience
 - Historical data and climate projections
- 
- A large orange triangle is positioned in the bottom right corner of the slide, pointing upwards and to the left. It is solid in color and has a sharp point at the top right.

MVI Next Steps

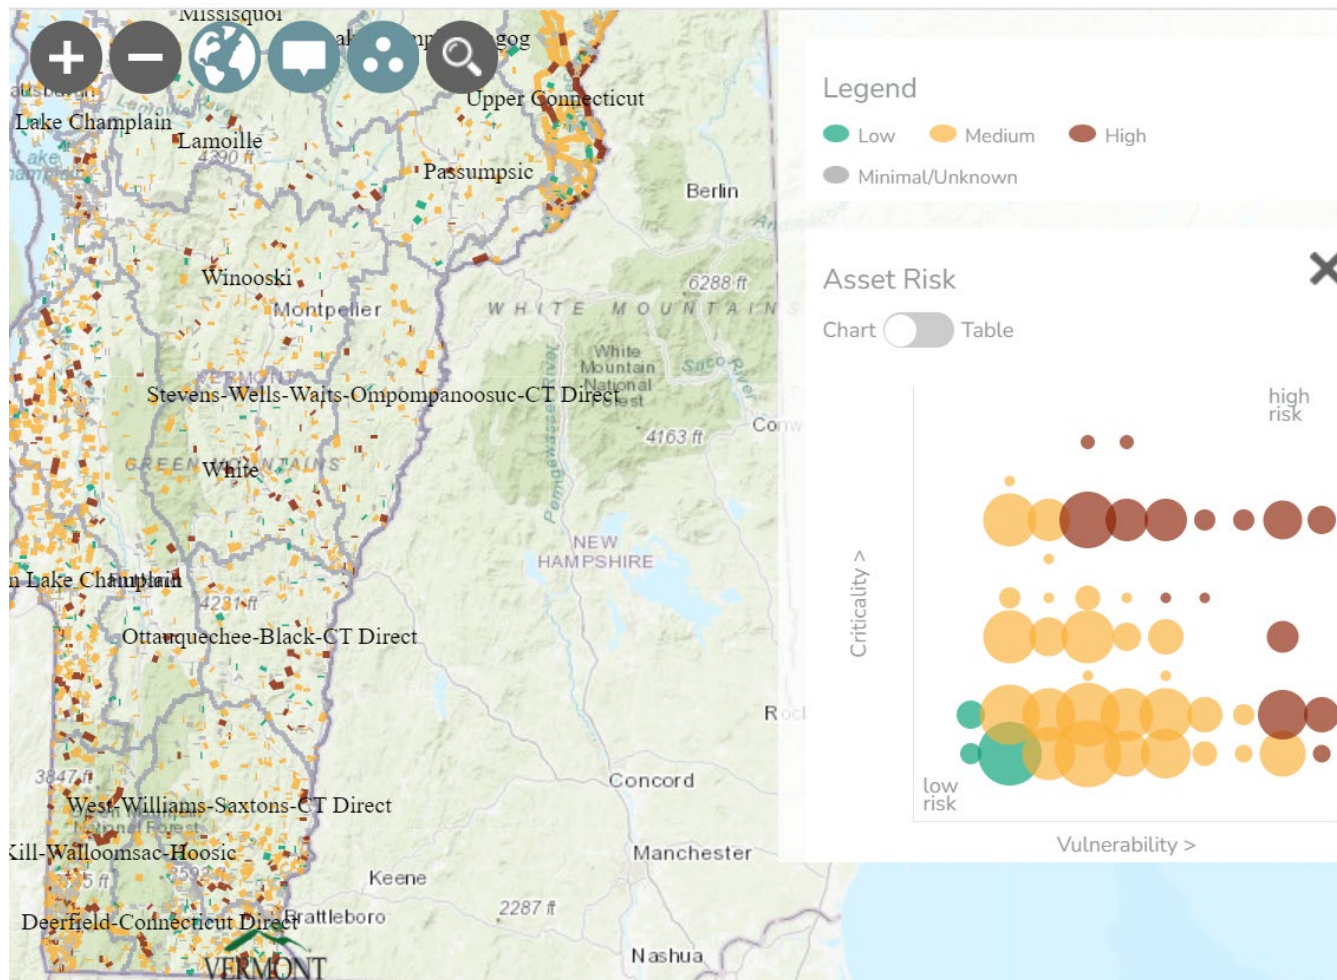

- Finalize MVI framework and methods
- Re-engagement with stakeholders
- Tool development
- Beta testing
- Resources and capacity to use tool

 Environmental Changes

 Community Solutions

There are **37,614** properties in **Vermont** that have greater than a **26%** chance of being severely affected by flooding over the next 30 years. This represents **15%** of all properties in Vermont.

In addition to damage on properties, flooding can also cut off access to utilities, emergency services, transportation, and may impact the overall economic well-being of an area.

Climate Vulnerability Index

Pulling in 184 sets of data to rank more than 70,000 U.S. Census tracts, the U.S. Climate Vulnerability Index helps you see which communities face the greatest challenges from the impacts of a changing climate. This tool shows what is driving the challenges, so policymakers and communities themselves can take action to build climate resilience where it is needed most.
